Dear Customer,

Thank you for your order.

Please find information and instructions for your window film below. Please read these instructions carefully before starting work.

Tools & Equipment:

Rubber window squeegee, ruler, knife, water spray bottle, film adhesive tape, aluminium strip or similar.

1. Clean the entire glass surface with a window cleaning product. Carefully, remove any debris on the glass with a scraper or razor blade, paying particular attention to the edges and corners.
2. Cut the film 1cm larger in width and height than the glass to be covered.
3. Remove the protective layer from the shielding film. Apply film adhesive tape to both sides of the film on one corner. When pulling apart these two strips, you can detach the cover film from the shielding film. While a person is holding the foil, slowly pull the cover foil away from the shielding foil with both hands. Spray the film evenly with water. Make sure that it is evenly wetted!
4. Spray the glass surface to be coated with water. Now place the wet adhesive side of the film on the wet window surface. The film should slide easily, if the surface has been sprayed correctly. Spray the room side of the film with water. This will prevent the friction of the squeegee as you firmly push the water out from under the film. Check the position of the film before you squeegee the film from the centre, vertically and horizontally, at least twice.
5. Trim the film to fit using the aluminium strip as a guide, to be placed firmly into the join of the glass and window frame. Make sure that the cut is just on the glass surface!
6. Water bubbles and stains will dry out over a period of 3 to 6 weeks, depending on the ambient temperature.
7. Care instructions: Clean all windows with chamois leather and an alcohol-based glass cleaner. Never wipe coated windows dry!
